

## For Immediate Release

### Kick Fast™ Catalyst from Prime Resins Makes Prime Flex 920 3x Faster

**Conyers, GA**—May 1, 2011- With the release of Kick Fast™ Catalyst, Prime Resins announces a breakthrough for users of Prime Flex 920. An engineered additive, Kick Fast™ Catalyst makes Prime Flex 920 react faster and reach full-rise three times faster.

Prime Flex 920 is a single component, water-activated, hydrophobic polyurethane injection resin. Its uses include cutting off gushing leaks in below grade structures, filling voids and stabilizing soils. A traditional workhorse, Prime Flex 920 is now a racehorse

Does speed matter? When you're 15 feet deep in a manhole repairing a 20 gallon per minute gushing leak, speed is critical. In another application, when stabilizing eroded soils associated with an earthen dam or levee, reaching full expansion faster provides greater control while using less product.

So how fast is fast? According to Stephen Barton, President of Prime Resins, "We now have the ability to make Prime Flex 920 initiate in less than five seconds, foam up and become tack-free in 22 seconds. This is a huge step forward in the technology and for our industry."

Long-term contracting partner, Scott Kammerer with Applied Foam Technologies in North Carolina adds this comment, "We successfully stopped a 20 gallon per minute leak in minutes with half the material by using Kick Fast™ Catalyst and Prime Flex 920. This is my new "go to solution" for stopping leaks and stabilizing soils."

**About Prime Resins:** Established in 1982, Prime Resins manufactures polyurethane grouts, epoxy injection resins, and polyurea coatings. With in-house R&D labs, formulation, packaging and technical support offered 24/7; Prime Resins has everything customers need to help solve their problems. Specified by engineers, injected by specialty contractors, and distributed through building suppliers, Prime Resins products are used primarily to stop leaks, stabilize soils, strengthen and protect concrete.
